

Sprout — Executive Prompt Playbook

Direct the AI to build and refine the app in plain language — no coding required

Digital lending platform

How to use: pick a topic → copy an "Example prompt" and send it → check the "What you'll get" column to confirm it matches your intent, then reword freely.

What is Sprout

Surface	Used by	Purpose
Customer App (/app)	Loan applicants	Apply, verify identity (e-KYC + selfie), upload docs, track status
Officer Console (/staff)	Loan officers	Review, score, approve/reject, escalate to a manager (maker–checker)
Back Office (/admin)	Config team	Set prescreen rules, products, documents, credit bureau, staff accounts
Database (Supabase)	System	Stores cases, customers, rules, permissions (secured with RLS)

Principles for effective prompting

1. Say "who" sees it and "why" — "let officers see the reason on decline" beats "add a reason field".
2. Command outcomes, not tech — describe what the user should get; skip file/table names.
3. Reference real things — case IDs (e.g. SV671962), menus, or a screenshot keep it precise.
4. Ask for testing — add "and test that it actually works" to get verification back.
5. One step at a time — break big work into sub-commands; review each before moving on.

Prompt library (prompt → outcome)

A. Customer-facing features (App)

Example prompt	What you'll get
<i>"Home should show the customer's name and credit limit; new sign-ups start at 0."</i>	Greets with the real profile name; new customers see 0 credit, not fake data.
<i>"Add a selfie step after the ID photo: blink, turn left/right, auto-capture, then preview before confirming."</i>	Guided-liveness face check + preview before submission.
<i>"Let users search for their bank by name."</i>	A type-to-search bank picker.
<i>"Pull already-disbursed, unpaid loans in as existing debt; default to 0 if none."</i>	Auto-computes outstanding debt from prior approved loans (keyed by National ID).
<i>"Make the Back button always return to the previous screen, across the whole app."</i>	Back navigation works correctly everywhere.
<i>"Show which step the customer is stuck on and let them resume."</i>	Home shows progress + a resume button from where they left off.

B. Officer Console (loan officers)

Example prompt	What you'll get
<i>"A decline must carry a reason; a different approver must decide; the approver can escalate to a manager."</i>	Reason required on reject; reviewer/approver separated (maker-checker); escalate-to-manager button with a note.
<i>"Show the submission date/time, sort oldest-first, and color cases waiting over 1 day differently."</i>	Queue shows submit time + red highlight for aged cases.
<i>"Let officers see the ID photos and selfie during underwriting, in the customer-info section."</i>	Identity card shows ID front/back + selfie.
<i>"Explain the formula behind each score component."</i>	Score page shows 5 components with transparent formulas.
<i>"Tell the officer every reason this case failed auto pre-screen."</i>	A banner listing every failed rule.
<i>"Officers can't see documents the customer uploaded — fix it."</i>	Docs appear in the console + set status Verified/Review/Re-request.

C. Back Office (configuration)

Example prompt	What you'll get
<i>"For prescreening rules, pick a product first, then set rules specific to that product."</i>	Per-product rule sets + Save/Reset buttons.
<i>"Build a credit-bureau database with National ID and score, e.g. Somchai 650."</i>	A credit_bureau table + a management tab in Back Office.
<i>"Make the Back Office look modern, on-brand, and desktop-ready."</i>	A navy-sidebar console laid out full-screen.
<i>"On mobile the menu bar disappears and looks cluttered — make it friendly."</i>	Slim top bar + a scrollable tab row + app shortcut links.
<i>"Test that each product's prescreening rules truly run, and flag every failed rule."</i>	Test results confirming rules are enforced, every rule captured.

D. Database & security

Example prompt	What you'll get
<i>"There should be a database that stores customer data."</i>	A customers table capturing name/mobile/income at sign-up.
<i>"Remove all mock/hardcoded data; use only real user input."</i>	Every screen shows real data, no placeholders.
<i>"I forgot the officer username/password."</i>	Password reset + the correct account is confirmed.
<i>"Add a manager account to receive escalated cases."</i>	A manager-role account to decide escalated cases.

End-to-end example

Goal: a tight, bank-grade loan-approval workflow.

1. *"Reviewer and approver must be different people; no one does both."* → maker-checker + a lock preventing self-approval.
2. *"A rejection must state a reason, shown to the customer and in the audit log."* → reason enforced + fully logged.
3. *"Let the approver escalate hard cases to a manager with a note."* → escalate button + "awaiting manager" status.
4. *"Test the whole flow and summarize the result."* → verification report + a link to try it.

The shape of every "response"

- **What was done** — bullet points in business language, not jargon.
- **Impact / things to note** — legacy data or limits are called out plainly.
- **How to try it** — test accounts, links, click-through steps.
- **A question back (if needed)** — when a choice needs your call; nothing is guessed.
- **Shipped** — code is committed/pushed automatically.

Closing tips

- Want options first: *"Propose 3 approaches with pros/cons and recommend the best."*
- Want a quality check: *"Review the code you just changed for bugs and improvements."*
- Want a report: *"Summarize every feature built so far as a table."*
- Not sure it's possible: *"Can you do X? If so, what's needed?"*
