

Sprout — Real Conversation Log

What was commanded and how the AI answered — from the real chat, grouped A–E

Digital lending platform

A. Customer App

EXECUTIVE

"I just created an account — why doesn't Home show the name/surname I entered, and if income was never filled the credit should be 0. There should be a customer database too."

SPROUT AI

Added a customers table (email, name, surname, mobile, income) with RLS. Sign-up now stores the real name/mobile in the DB + localStorage, so Home shows the real name instead of "Somchai Jaidee." Credit stays ฿0 until income is entered ("Add income to unlock your limit").

EXECUTIVE

"Is there any mock data left? Switch everything to real user input — no hardcoding."

SPROUT AI

Overhauled so all data comes from real input: added National ID/DOB/gender (KYC), Employer + Purpose. The officer-facing case switched every hardcoded field (name/phone/ID/employer/income/DSR/score) to real values. DSR is computed as debt/income; credit score is pulled from the bureau by National ID (0 if absent, not a fake 720).

EXECUTIVE

"Why does logging in with kanychar@hotmail.com still show Somchai on Home?"

SPROUT AI

Cause: on login the old code never loaded a profile — it only read the localStorage set at sign-up, leaving the HTML default "Somchai." Fix: on successful login, set the profile to the logged-in email and fetch the customers row by email. This account predates the customers table so it has no stored name → it now shows "kanychar" + ฿0 (correct for the data on hand).

EXECUTIVE

"Make this into Name and Surname, showing what the customer typed — no hardcoding."

SPROUT AI

Create-account now has two fields, Name + Surname. Sign-up stores first_name/last_name/full_name from real input, flowing everywhere (home, cards, the officer case, and recovered on login). The password-strength bar no longer hardcodes "Strong" — it reacts to what's typed.

EXECUTIVE

"The surname overflows — lay it out cleanly for iPhone 17 Pro, and remove the green "S" at the top."

SPROUT AI

Added min-width:0 to the flex columns so Name/Surname shrink to a clean half-and-half, no overflow on iPhone 17 Pro. Removed the green "S" chip from the top bar (nothing in JS referenced it).

EXECUTIVE

"The Back button should return to the previous screen — apply this across the whole app."

SPROUT AI

Problem: the stack started at [home] although the app opens at onboard (so Back jumped to home), and transient loading screens got pushed. Fix: seed the stack from the actual opening screen, separate push (forward) from replace (redirects skip loading screens), and sync with browser back. Every screen now steps back one screen at a time.

EXECUTIVE

"This customer has no pending application — design an empty state, show on Home which step they're stuck on, and let them resume."

SPROUT AI

The "Your application" card now has 3 states: Not started (→ Start), In progress ("stopped at step N of 4" + progress dots + Resume Step N back into that exact step), and Submitted (→ Track status). Recent activity is real, and progress is saved to localStorage on each step.

EXECUTIVE

"Make this match the mockup, add a step indicator on every screen, and make the bank field selectable + searchable."

SPROUT AI

New Receiving-account screen: a single bank row (logo+name+>) and a real account-number input. A Select-bank screen searches by name/code across 12 Thai banks with logos and a ✓ on the chosen one. The 4-step progress bar now appears on every flow screen (added to tax + e-sign).

EXECUTIVE

"Why can't I see the full loan agreement?"

SPROUT AI

Cause: the box was locked to 130px with overflow:hidden, a fade, and "..." truncation. Fix: made it fully scrollable (max-height 240px, overflow-y:auto), removed the fade, and added all 8 clauses (payment, EIR, early repayment, late fees, NCB reporting, same-name account, PDPA, Thai law).

EXECUTIVE

"Pull already-disbursed, unpaid loans in as existing debt; default 0 if none."

SPROUT AI

The Existing-debt field now sums the monthly payments of that customer's disbursed cases (read from the DB); ฿0 when there are none. It's read-only (system-computed, tagged "· auto") and feeds DSR/pre-screen automatically.

EXECUTIVE

"I disbursed 20,000 — why does it show 0? Still 0."

SPROUT AI

Switched the key to National ID: sums the monthly of disbursed cases with a matching national_id. Since Calc precedes KYC (ID unknown), it now recovers national_id from the account's cases (email/phone) and remembers it. Linked kanych's case (SV570286, ID 1103700539111, ฿3,491) to kanychar@gmail.com → after login it shows ฿3,491.

EXECUTIVE

"This account has an active loan (income was entered) but Home shows credit available = 0."

SPROUT AI

Cause: Home read income from localStorage (0 after login) while the real income lives on the case. Fix: on Home, fetch the latest case (matched by National ID/email/phone), compute the limit from its income (e.g. 45,000 → ₺180,000), and show the real status (In review/Approved/Loan active with Track/Repay).

EXECUTIVE

"In real use the Capture/Use buttons should sit near the camera, no scrolling up and down."

SPROUT AI

Moved  Capture / Retake / Use photo directly under the camera frame (previously docked at the bottom of a long page) — your eyes stay on the camera and your thumb reaches the button without scrolling.

EXECUTIVE

"Why is some data missing? / This person just signed up — why is there already data? There should be none."

SPROUT AI

Missing data: customers clicked Continue past optional steps → fixed by requiring National ID/DOB/gender (KYC) and occupation/employer (Income) before proceeding. Stale data: sprout_progress used one shared key → fixed by stamping the account email so another email's progress is ignored, and a new account sees "Not started."

EXECUTIVE

"Officers currently can't see the captured photos — let them view them in customer info during underwriting."

SPROUT AI

- Cause: the ID photos lived only on the customer's device, never uploaded. Fix: on submit, upload front+back to Supabase Storage and record them in case_documents. The officer side gained an "ID document"
- e-KYC" card showing front/back thumbnails, viewable full-size in a lightbox.

EXECUTIVE

"Add a selfie step after the ID card and show it on the staff side in customer info."

SPROUT AI

- Flow: KYC → Selfie → Income. An "Identity verification" screen shows a front camera in a circle + Capture selfie → Retake/Use; the selfie is required before continuing, uploaded to Storage + case_documents. On staff, an "Identity"
- e-KYC" card shows the selfie as a round photo alongside ID front/back.

EXECUTIVE

"Add a face frame, prompt to blink and turn left/right, auto-capture, then let me preview."

SPROUT AI

Built guided liveness (no manual shutter): position in the circle → blink → turn left → turn right → hold still → auto-capture, with a progress ring filling per step. Then a Preview shows the shot with Retake/Use photo; live view is mirrored, the saved image is not.

EXECUTIVE

"Why are the ID photo and some fields missing, and the selfie should show here too / where did phone go / pull the phone from registration."

SPROUT AI

Cause: this case used Resume to skip KYC → no ID card/number. Fix: identityErr() requires ID number + both ID photos + selfie before submitting. Phone: added a Mobile field in KYC, prefilled from registration, locked read-only with a "from registration" tag so every application has a number. The selfie was already in the DB — just needed a hard refresh.

B. Officer Console

EXECUTIVE

"The UI overlaps — let status be set and shown like other document types."

SPROUT AI

Root cause: the View button used .btn width:100%, filling the row and overlapping the filename. Fix: View is now content-sized on its own actions row, long filenames truncate with ..., and a right-hand status badge (Verified/Needs review/Re-request) matches other rows and updates instantly on click.

EXECUTIVE

"The layout in the red circle isn't nice — fit it into the yellow area; the app must be modern for first jobbers."

SPROUT AI

View sits compactly on the left (40px tall); the segmented control (Verified·Needs review·Re-request) moved onto the same row and stretches to fill the space, the three status buttons split evenly at equal height — one clean, modern unit.

EXECUTIVE

"Order customer info first (name, surname, ID, occupation), then the loan request, so staff instantly see who and what they're reviewing."

SPROUT AI

Rebuilt Application data: a top summary (left = who: avatar+name+ID+occupation, right = the ask: amount+product+term), the Applicant card first (name→ID→phone→occupation→employer→income→debt), then the Loan-request card — matching an underwriter's thought process.

EXECUTIVE

"Hide the item in the red circle, test that the product's underwriting rules truly run, and show staff why a customer failed auto pre-screening."

SPROUT AI

Removed the "Name matches" card. Confirmed rules run per-product (default 10; Loan-not-alone disables age+paytype; Salaryman-Quick disables nationality) against the real profile. Added prescreen_pass/prescreen_fails to the case, so the hub shows a green "passed" or red "did not pass" banner with the exact failed rules.

EXECUTIVE

"What does the button in the red circle do? If it doesn't work and is useless, remove it."

SPROUT AI

The "Request another document" button only wrote a log + toast — it never reached the customer (nothing appeared, no document specified). It was a dummy, so it was removed (a real version is possible: pick a document → attach to the case → customer sees it + a notification).

EXECUTIVE

"Add an instruction explaining the formula behind each number."

SPROUT AI

The 0–100 affordability score = 5 parts: DSR $35 \times (1 - \text{DSR}/70)$; Bureau $30 \times (\text{bureau} - 300)/600$; Income $\min(15, \text{income}/3000) + \text{pay-type bonus}$; Obligations $10 \times (1 - \text{debt}/\text{income})$; History baseline +2. score_factors are stored at submit, and the staff Score-breakdown page shows +points/max plus the formula line (f ...) under each.

EXECUTIVE

"The NCB score exists — why isn't it showing?"

SPROUT AI

Cause: the score was computed and frozen at submit — those cases were sent before the bureau score existed → bureau component 0. Fix: submitCase now fetches the bureau score fresh at submit, and backfilled the old case SV671962 (67→84, no-hit→clear).

EXECUTIVE

"Show the submit date/time, sort oldest-first, and color cases over 1 day differently so officers pick them up fast."

SPROUT AI

Each case shows a 🕒 date/time + "x ago" line; the queue sorts by created_at ascending (longest-waiting on top, FIFO); cases past 24h get a light-red background + red border and an 🕒 Over 1 day" tag.

EXECUTIVE

"A decline must show a reason; there must be an approver; and the approver can escalate to a manager."

SPROUT AI

1) Decline requires a reason: choosing decline clears the note and shows a red "reason required" tag; submitting empty is blocked. 2) maker-checker: a reviewer can't decide their own case. 3) Added a "📌 Send to a manager to decide" button (note required) → pending_manager. The hub shows Reviewer note/Escalation note/Decision reason; added an escalation_note column.

EXECUTIVE

"Where are the decide and send-to-manager buttons?"

SPROUT AI

- SV671962 was reviewed by reviewer@sprout.test (the account you're on) → the buttons are hidden by separation of duties. Sign out and log in as approver@sprout.test → the case shows "Make decision
- or send to a manager" (Approve/Reject/📌 Send to a manager). manager@sprout.test receives escalated cases.

C. Back Office & Configuration

EXECUTIVE

"Make the Back Office modern, on-brand, and desktop-ready."

SPROUT AI

Replaced the 402px phone frame with a full-height console (max 1280px): a sticky desktop header, the case queue/search as a card grid, detail pages as a centered 900px column, using the same design tokens as the main app (cobalt/navy/lime) with a soft-blue gradient and hover.

EXECUTIVE

"Yes (build the full Back Office sidebar)."

SPROUT AI

Left sidebar (desktop, after login): logo + My tasks/Search cases (active highlight) + avatar/name/role/Sign out below, on navy with white text. The whole app becomes a rounded, shadowed console window; mobile is untouched (sidebar hidden, single-column flow as before).

EXECUTIVE

"Where is the back office for setting up values?"

SPROUT AI

- Built /admin/ as a desktop console matching the officer design: a navy sidebar (📁 Products
- 🛡️ Pre-screen rules
- 📄 Documents
- 👤 Staff & roles) + cross-app links + Sign out, with full CRUD over the 4 tables. Link: <https://kanychar-ai.github.io/Sprout-app/admin/>

EXECUTIVE

"Prescreening rules should say which product they belong to, with a dropdown, an easy UI, and Reset/Save."

SPROUT AI

Each rule card has an "Applies to" dropdown (All products or a product name from products), saved to prescreen_rules.product. Sticky 🔄 Reset + 💾 Save buttons stay on top, and the customer app only applies rules matching the chosen product.

EXECUTIVE

"I want to pick a product first, then have its rules as a subset."

SPROUT AI

A top "Set up rules for" dropdown → picking a product turns the checklist into that product's rule set. The PK became (product, key), product=" is the default (the original 10 rules); unset products start from default and get their own set on Save, with the customer app falling back to default.

EXECUTIVE

"Remove All products from the dropdown; configure one product at a time."

SPROUT AI

Removed "All products (default)" from the dropdown → only product names remain, defaulting to the first product, one at a time. The default set still lives in the DB as a template + customer-app fallback; it just isn't shown for editing.

EXECUTIVE

"For the credit-bureau check, create a new database with ID and score, e.g. Somchai 1-1037-...-12-3 = 650."

SPROUT AI

A credit_bureau table (national_id → name, score) + RLS, seeded with Somchai 650. Pre-screening looks up the National ID for the real score (650 vs min 600 = pass). A new 📊 Credit bureau tab in the back office adds/edits/deletes records.

EXECUTIVE

"Don't repeat headers every row (save space) and allow sorting (ID/first/last); split first and last name."

SPROUT AI

Column headers once (National ID·First·Last·Score), rows are pure inputs. Added first_name/last_name (backfilled Somchai/Jaidee) and a "Sort by" dropdown (ID/first/last, numeric-aware) that keeps edits when re-sorting.

EXECUTIVE

"On mobile the other tabs all disappear."

SPROUT AI

Cause: mobile tabs still had width:100% from desktop → the active tab filled the row and pushed the rest off-screen. Fix: on mobile tabs became content-sized pills (width:auto) that wrap → all 5 visible.

EXECUTIVE

"The staff/customer app links vanished; make it mobile-friendly but keep desktop nice / the UI is cluttered, fix it."

SPROUT AI

- Mobile: a slim top bar (brand left
- round   icons + Sign out right), tabs as a single horizontal scroll row with a hidden scrollbar. The Officer/Customer links are back; desktop is unchanged (only the mobile media query changed).

EXECUTIVE

"Test that each product's prescreening rules truly run and that failures capture every rule."

SPROUT AI

Ran tests with the same logic as app.js + real DB rules: Somchai/Salaryman = PASS (9 rules); a bad applicant = all 8 failures captured; the same person passes Loan-not-alone but fails Salaryman (different enabled rules); no bureau hit → credit 0 < 600 = fail. Proves per-product enforcement and records every rule.

EXECUTIVE

"Actually check documents — required ones must be uploaded or it fails."

SPROUT AI

Previously docsComplete was hardcoded true. Now docs.js adds allRequiredUploaded() — every Required document (except e-KYC ones) must have a real file; buildProfile feeds this into pre-screen so a gap fails the documents rule. Tested: complete → PASS, missing → UNDER REVIEW.

D. Data, Accounts & Links

EXECUTIVE

"The links again / the admin backend link."

SPROUT AI

-  <https://kanychar-ai.github.io/Sprout-app/>
-  Customer /app/
-  Officer /staff/
-  Admin /admin/. On desktop you get the full sidebar; hard-refresh the first time. Pages deploys from the latest branch — wait ~1 min.

EXECUTIVE

"I forgot the username / password."

SPROUT AI

Reset: approver@sprout.test (or reviewer@sprout.test), password Sprout!2026. The earlier slip was typing approve@ — the correct one is approver@ (with the "r"). Works on both /staff/ and /admin/; both are role officer (no admin/manager account at the time).

E. Status & General

EXECUTIVE

"How many % are left?"

SPROUT AI

Two views: as a full-flow demo/prototype → ~90% (all three apps work and connect); as a real production system → ~60–65% (still stubbed: e-KYC/OCR, real disbursement, admin permissions, real bureau/AML). Suggested doing "real data instead of mock" next as the highest-impact step.

"Why is it slow? Tell me what you're doing."

SPROUT AI

Nothing was running — the last task was committed/pushed and I was waiting for the next instruction. The "slowness" is GitHub Pages taking ~1 min to build after a push (GitHub's side), not background work. Asked what to do next.
