

Sprout — Every Prompt Used (Command Log)

The raw commands used to build and refine the app — prompts only, no commentary

Digital lending platform

A. Customer App

- 1 "Show the customer's name on Home, and a brand-new sign-up's credit limit must be 0."
- 2 "There should be a database that stores customer data."
- 3 "Split this into separate Name and Surname, show exactly what the customer typed — no hardcoded values."
- 4 "The surname field overflows the screen — lay it out cleanly for iPhone 17 Pro."
- 5 "The Back button must always return to the previous screen — apply this logic across the whole app."
- 6 "This customer has no application yet — design an empty state, show on Home which step they're stuck on, and let them resume."
- 7 "Add a step indicator on every screen, and make the bank field selectable with search-by-name."
- 8 "Why isn't the full loan agreement visible? Make it fully scrollable."
- 9 "Pull in already-disbursed, unpaid loans as existing debt; default to 0 when there are none."
- 10 "Use the National ID as the reference key."
- 11 "Pull the phone number straight from registration."
- 12 "Add a selfie step after the ID-card photo."
- 13 "Add a face frame, prompt the user to blink and turn left/right, auto-capture, then let them preview before confirming."

B. Officer Console

- 14 "Customers can upload documents but officers can't see them."
- 15 "The UI overlaps — fix it so status can be set, shown like the other document types."
- 16 "Order the data with the customer information first, from a loan underwriter's point of view."

- 17 "Let officers view the captured photos (ID + selfie) in the customer-info section during underwriting."
- 18 "Add an explanation of the formula behind each score component."
- 19 "The NCB score exists — why isn't it showing?"
- 20 "Show the application submit date/time, sort oldest-first, and color cases older than 1 day differently."
- 21 "Tell the officer every rule reason a case failed auto pre-screening."
- 22 "What does this button do? If it doesn't work and serves no purpose, remove it."
- 23 "A decline must show a reason; there must be an approver; and the approver can escalate to a manager."

C. Back Office & Configuration

- 24 "Make the Back Office look modern and on-brand, with a desktop-ready resolution."
- 25 "For prescreening rules, let me set which product each rule belongs to, with a dropdown and Save/Reset buttons."
- 26 "Let me pick a product first, then show its rules as a subset of that product."
- 27 "Remove "All products" from the dropdown — configure one product at a time."
- 28 "For the credit-bureau check, create a new database with ID and score, e.g. Somchai Jaidee has 650."
- 29 "Test that each product's prescreening rules truly run, and flag every failed rule to staff."
- 30 "Actually check documents — required ones must be uploaded or it doesn't pass."
- 31 "On mobile the menu bar disappears and the UI is cluttered — make it friendly, while keeping desktop polished."

D. Data, Accounts & Quality

- 32 "Is there any mock data left? Switch everything to real user input — no hardcoding."
- 33 "Please give me the link to the admin back office."
- 34 "I forgot the officer username / password."

E. Reusable general commands

- 35 "Propose 3 approaches with pros and cons, then recommend the best one."
- 36 "Review the code you just changed for bugs and things to improve."
- 37 "Summarize every feature built so far as a table."
- 38 "Test that it actually works and summarize the result."
